Milestone 3 Brief Explanations

- A 3rd party self-sovereign web 3 NFT identity platform is contracted to manage user identities in the PROJECT FUTURE community
  - Vatom has been formally contracted to manage user identities in the PROJECT FUTURE community, see attached agreement for evidence of the contract being in place.
  - Ability for creation of an account that will be used to manage user identities for the wallet and the metaverse has been created. The demo video of "Vatom Account Creation" shows this in detail.
- This platform is configured to only request and share information that is material to the interests of PROJECT FUTURE's new venture engagement
  - Vatom's platform allows for the customization of the experience per community/group/brand. For example, an XPrize Carbon Sequestration community has its own look and feel, reputation, functionality etc.
- The platform is vetted for security and scalability
  - There has been extensive scalability testing both in testing and real world environments. The platform is architected with enterprise level security. We are currently going through our own internal security review, as we do regularly. These results can be shared upon request. See the attached Vatom Information Security Policy document attached for further details.
- An initial deployment of this platform is deployed within the community toolset
  - The Vatom platform has been up and running for many years with a large number of significant clients and millions of users engaging with the technology. The specific customizations and features for this grant are implemented within this existing framework.
- It is integrated with other technologies / processes including metaverse, KYC / payments, etc
  - The ability to to set up billing information in order to receive payments within the platform is available. The demo video of "Payment Setup" shows how this process works in detail.
